## ABSTRACT OF THE DISCLOSURE

An electrophotographic developer is provided for realizing high-quality images and superior reproducibility of laser dots in a low coverage region and reduced unevenness of color in halftone solid images. The electrophotographic developer includes a toner and a carrier. The toner has a shape factor of 140 or less and a volume average particle size distribution GSDv of 1.3 or less. The carrier has a coat resin layer on a core material, the coat resin layer containing a conductive powder. The core material has a dynamic electric resistivity of 1  $\Omega$  cm or less under an electric field of  $10^4$  V/cm in a form of a magnetic brush. The conductive powder has an electric resistivity of  $10^1$   $\Omega$  cm or greater and  $10^6$   $\Omega$  cm or less. The carrier has an electric resistivity in a range between 10 and  $1 \times 10^8$   $\Omega$  cm. An image forming method is also provided wherein the electrophotographic developer is used for development in a developing stage.
